## The sustainability triangle

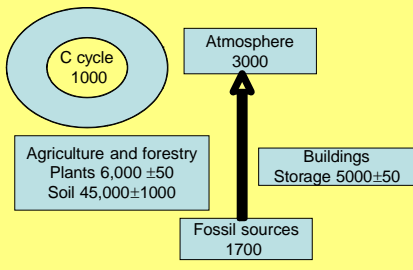

**Aim: acting sustainably**

## LCA: GHGs are only one aspect

Example: ecoindicator

## C flux (kg/a) per capita in CH

Estimation of C fluxes in Switzerland for the year 2005 (after Müller & Bacchini EAWAG).

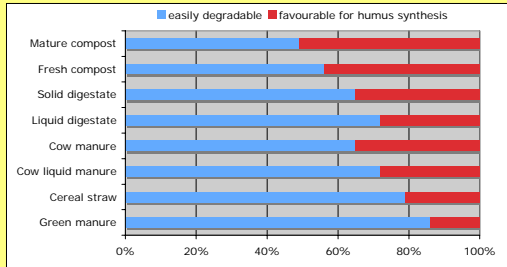

## Converting C to CO<sub>2</sub>

- 1 kg C → 3.67 kg CO<sub>2</sub>
- 1700 kg fossil C per capita and year  
→ 6239 kg CO<sub>2</sub> emitted
- These fossil C sources are the problem,  
as they enrich the atmosphere
- Aim: substitute fossil resources

## Savings from the production of renewable energy from AD

Parameter	Value	Unit
Biogas yield	100	m <sup>3</sup> /ton <sub>sep. coll. waste</sub>
Calorific value of biogas (60% CH <sub>4</sub> )	600	kWh/t <sub>waste</sub>
Electricity generated (30% efficiency)	180	kWh/t <sub>waste</sub>
Net electricity produced (70% of tot. generated)	120	kWh/t <sub>waste</sub>
Avoided emissions from electricity production	54	kg <sub>CO2</sub> /t <sub>waste</sub>
Heat recovered for the CHP option (80%)	336	kWh/t <sub>waste</sub>
Net heat exported for the CHP option (80%)	286	kWh/t <sub>waste</sub>
Avoided emissions from CHP heat export	81	kg <sub>CO2</sub> /t <sub>waste</sub>

### Soil improvement: crediting C in compost and digestate

Proportions of easily degradable and more persistent organic matter (i.e. more favourable for the synthesis of humus), in various organic fertilisers, Source: J. Reinhold, VHE BBS e.V.

### Substituting peat: a most promising GHG saving

- Crediting organic matter in compost and solid digestate as a substitute of peat
- Peat is not used in agriculture but only in horticulture => only 1/3 of compost utilized may be credited as peat substitution
- With transport (depending on location): 200 - 300 kg CO<sub>2</sub> savings

### Savings due to nutrient replacement

Nutrient element	Nutrient content [kg / ton <sub>biowaste</sub> ]	Amount accounted for as fertilizer [%]	Emissions from mineral fertilizers [kg <sub>CO2 eq.</sub> / kg <sub>element</sub> ]	Avoided CO <sub>2</sub> emissions [kg <sub>CO2 eq.</sub> / ton <sub>biowaste</sub> ]
N	4.0	10	5.30	2.12
P	1.5	100	0.52	0.78
K	3.0	100	0.38	1.14

GHG savings due to substitution of mineral fertilizers, per ton of biowaste treated

Source: AEA Technology, 2001 Waste Management Options and Climate Change, Report to the European Commission

### Total possible GHG savings from biowaste treatment

GHG saving by	kg CO <sub>2</sub> eq.
Anaerobic digestion with CHP option	135
C-sink in the soil by added humus	80
Peat substitution and avoided transport	200 - 300 <sup>1</sup>
Replaced mineral fertiliser	10
<b>Total</b>	<b>400 - 500</b>

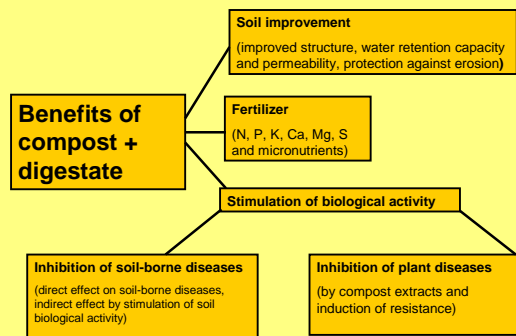

<sup>1</sup> 94 to 188 (substitution) + 120 to 180 (transport)

**Maximal CO<sub>2</sub> saving: about 1% of the fossil emissions**

### Further beneficial properties of compost

- Physical: *soil structure, protection against erosion, water retention*
- Chemical: *fertilization, soil buffer, multiple fertilization*
- Biological: *microbial inoculum, nourishment for soil organisms, influence on the soil flora, plant roots, seeds, etc...*
- [www.codis2008.ch](http://www.codis2008.ch)

### Positive properties of compost and digestate

## Conclusions 1

- To properly assess sustainability, the three main areas of focus, **economy, environment and society** must be considered
- GHGs are **only one aspect** of an ecological assessment (LCA)
- Biowaste only makes up about **1%** of the biogenic C cycle
- Fossil C sources are **larger** than the biogenic C flux
- This fundamental problem cannot be solved by biowaste treatment alone
- But: the use renewable energy sources (AD) and substitution of fossil resources (peat) can nevertheless contribute

## Conclusions 2

- CO<sub>2</sub> savings by **AD** are a certain gain
- The savings due to **peat substitution** by 1/3 of the compost (going to horticulture) are even larger
- The savings by **nutrient substitution** are rather marginal
- The benefits brought by **physical effects** on the soil (water retention, less erosion.....) are promising
- **A lot of research** is still necessary before we can integrate these aspects correctly in LCAs
- An LCA aims to be a **comprehensive** ecological assessment
- But only if it is **really** comprehensive will we get the right picture!

Thank you for your attention !
