

Survey on national/local plans allocating resources for soil management practices that include the utilisation of compost

Introduction

In order to point out the key aspects of national or local policies put in place so far to stimulate the adoption of good land management practices aimed at preserving soil health and fertility, that include the reintegration of organic matter by means of compost, we have collected and analysed some of the most significant incentivising schemes adopted in some Member States, here shortly summarised.

The following case studies were considered:

- Local humus build-up CarboCert (Germany, GE1)
- RETERRA CarboSoil (Germany, GE2)
- Healthy Soils for Healthy Food (Austria, AU1)
- Humusprojekt (Ökoregion Kaindorf, Austria, AU2)
- Utilisation of organic fertilisers in place of mineral fertilisation (Italy, Region Piedmont, IT)
- French Carbon Standard CARBON AGRI (France, FR)

EUROPEAN COMPOST NETWORK ECN e.V.

Organic Farming Schemes

The schemes are equally divided into public and private funded initiatives, mostly still active (or about to end), and all of them address farmers as the beneficiaries (in the GE2 case, organic soil improvers issuers are possible beneficiaries as well).

Despite all these schemes are focussed on the return of organic matter to soils and can thus be considered as "carbon farming" initiatives, some differences emerge; while some of them (GE2, FR, AU2) are specifically aimed at offsetting CO₂ emissions to the atmosphere through the storage of organic carbon in soils, other ones put the emphasis on other aspects, such as the replacement of mineral fertilisers (IT) or the improvement of soil health through the commitment of farmers in adopting good agronomical practices (AU).

Since the effects of the use of compost can be observed on the medium-to long-term, all the schemes are long lasting (5 years, with possible monitoring of soil beyond the end of the program, in order to assess the evolution of organic matter). At least two schemes (AU, GE, AU2) include a specific training to farmers, so to make them aware of the importance of soil organic matter and the agricultural practices that are "soil friendly".

The rewarding of the schemes analysed can either depend on the results obtained or on the simple adoption of a list of activities foreseen by the agreement between farmers and the scheme manager. In the first case (FR, GE, AU2), farmers are paid in proportion to the amount of organic carbon (or effective organic matter) they have stored in their soils along the duration of the activity. It is more interesting to note that some schemes (AU, IT) acknowledge the simple commitment of farmers in making specific actions in favour of soil health, according to an undersigned agreement between the parties (in one case, the scheme manager is a public entity, Region Piedmont: in the other one a private company, the Spar supermarket chain).

ECN INFO PAPER

Depending on the rewarding approach (results or activities based) the paying methods are different:

- Obtainment of carbon credits that are purchased to the farmer by the scheme management entity at a price in line with the market of the Emission Trading Schemes (accounted as per tonne of CO₂ offsets);
- Purchase of the vegetables cultivated at a price higher than their market value, taking in account the additional efforts made by farmers;
- Fixed payment per cultivated surface (€/ha) that has been managed according to the good agricultural practices and replacing mineral fertilisers with compost.

In one case (GE2) the reward does not consist in a monetary payment, but in the assignment of a label that certifies the commitment of the farmer to a proper soil management, and a calculation of the amount of humus stored in soil.

A monitoring activity is foreseen by all the schemes. In one case (IT), the monitoring is based on records that must be kept by farmers through random inspections; the other schemes include the periodical sampling and analysis of soil by independent qualified inspectors until the end of the program, basically to evaluate the evolution of soil organic matter (or the effective organic matter).

About the European Compost Network (ECN)

The **European Compost Network** (ECN) is the leading European membership organisation promoting sustainable recycling practices by composting and anaerobic digestion of organic resources and guarding over the quality and safe use of the recovered organic fertilisers and soil improvers. With 68 members from 27 European Countries ECN represents more than 4500 experts and plant operators with more than 45 million tonnes of biological waste treatment capacity.
